

Catcord – User Manual

Catcord – User Manual

Catcord helps you communicate across languages in Discord.

When you post in a language-specific channel (for example, #german), Catcord mirrors your message into other mapped channels (such as #english or #french). Messages are translated automatically and appear as if you wrote them yourself – with your name and avatar.

How to Use

- Write messages in your normal language channel.
- Attach images or files – they will be mirrored as well.
- Replies: if enabled by admins, mirrored messages will include a short translated note showing what you replied to.
- Threads: if enabled by admins, messages in threads will be mirrored into threads with the same name in the other channels.

Tips

- Keep messages clear and simple for better translations.
- If a translation seems wrong, rephrase and resend.
- Mentions are neutralized to avoid pinging people across different channels.

Troubleshooting

- If your message does not appear in other channels, ask an admin to check if the channel is mapped and that the bot has permissions.
- If an attachment fails to show, try again with a smaller file.
- If translations are inaccurate, note that Catcord uses automatic translation (DeepL or OpenAI) and accuracy may vary.

Privacy

- Catcord uses webhooks to mirror your messages with your display name and avatar.
- The bot does not DM you and does not store your personal data.
- Only configuration (channel mappings and settings) is stored by server admins on the host.

Need Help?

Contact your server admins or moderators. They can check Catcord's status with slash commands and adjust its settings if needed.
